The Reveal is the newest addition to our family of the cables. It was created with one particular goal in mind: to re-define the limits of magnetic conduction, a common-sense yet controversial technology. Magnetic Conduction by nature is so unique that these cables really shouldn't even be called "cables" as they work from a completely different electrical model.

Our cables are set apart with one basic difference in concept: they carry not only electricity, but also electromagnetism. That very fact starts to define the inventive nature of Magnetic Conduction. It works in not one realm of electrical energy but both.

So is it definitively and decidedly different? The Reveal has been designed to be that critical component that connects you to the truth of all you have been missing with conventional high-end wire and cable.

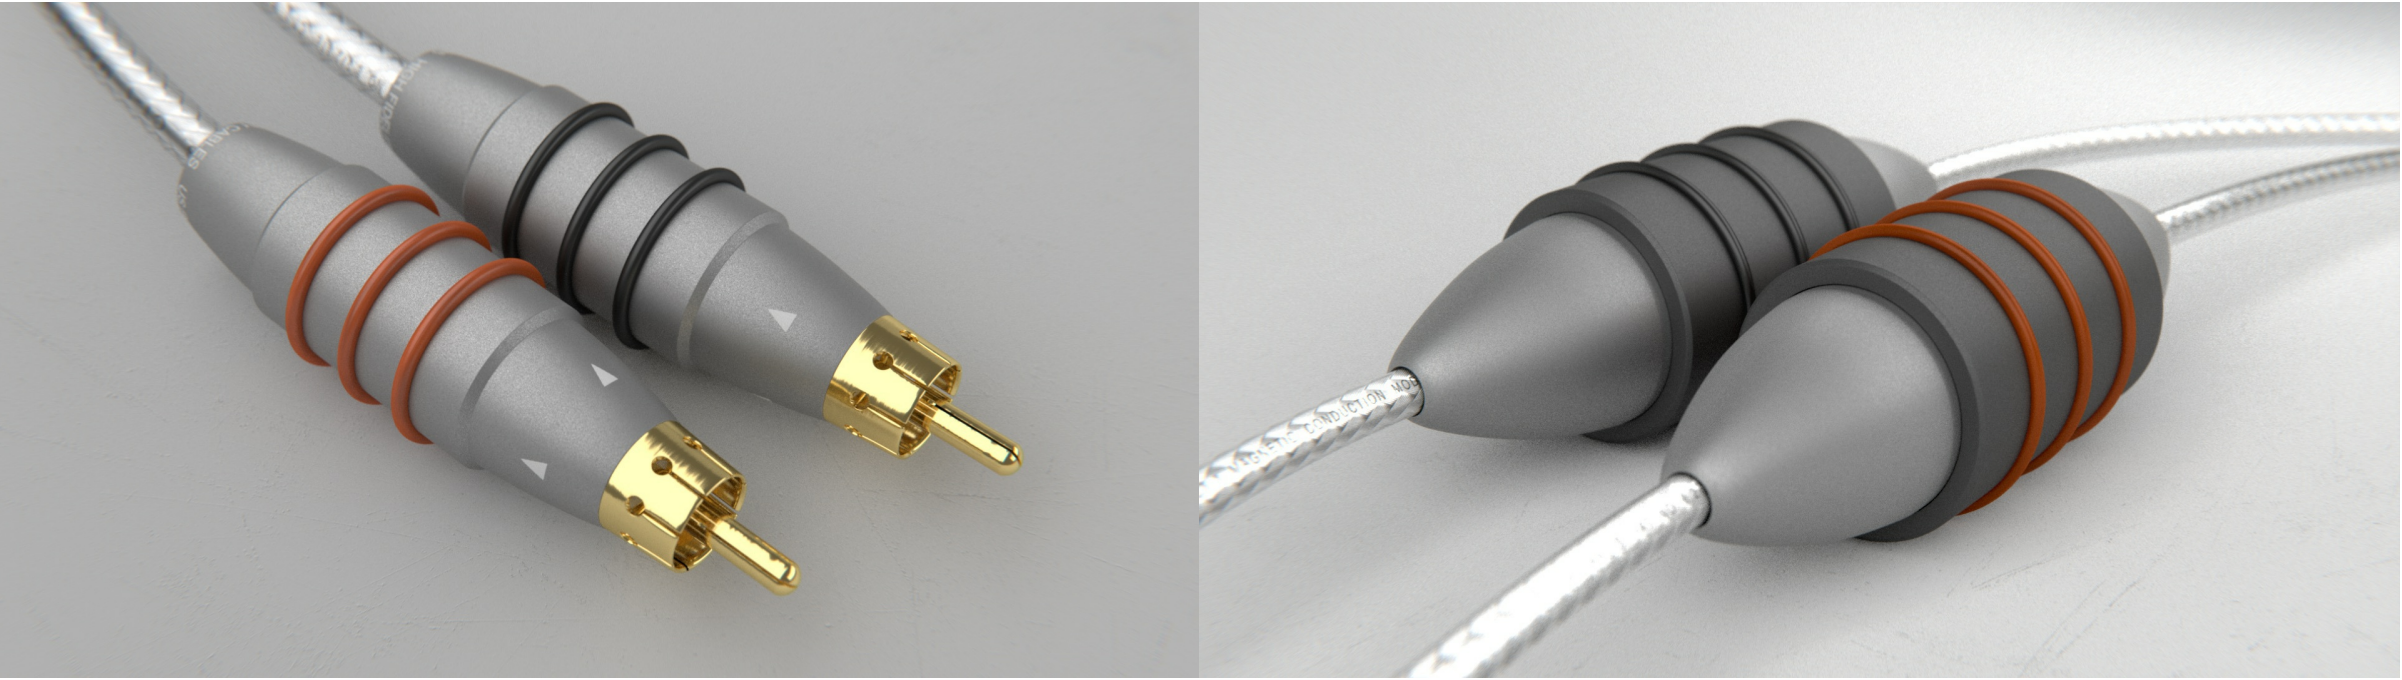

Renowned audio reviewer Harry Pearson called us the "aptly named" High Fidelity Cables. He discovered this profound new technology and shared his enthusiasm. Now it is time for the CT-1 Reveal to stand up to its name.

The challenge of doing the Reveal was unique in nature. The Goal itself was considered maybe too grand by some. However inventor Rick Schultz wanted to create a cable that outperforms all conventional high-end wire. A product that, against its peers, is laughably inexpensive. One that would be less cost and higher performance than any other true reference audio cable.

A cable that once and for all Reveals the technical advantages and differences of Magnetic Conduction. A product to exceed all other cables regardless of cost, and do it at a fraction of the price of any other product in the high-end audio marketplace.

*Magnetic Conduction is a directional technology. For proper performance please be sure that the arrows on your cables point away from your source and toward your amps/outputs.

\$699 for 1m (each additional 0.5m is \$150)
