(I've never been able to say this yet) 🙌 Well Actually! 🙌 All of Office 365 is (almost finished) being completely rewritten in this little scripting language called #JavaScript. And Skype And Microsoft Teams And @Code And all of @MSEdgeDev Debug Protocol (instead of C++) nbd

Also, C++ is RFCs for adopting JavaScript's module system because it's so damn good for static analysis. 🙌🙌🙌 cc @jfbastien please make me look stupid if I'm wrong

Congratulations - is that the same for the mac desktop app - if so it makes clear why the MS Office Apps are so slow ☹️

Which part of office 365? The web versions or the desktop? You mean they are all gonna be electron apps?
[Afficher la conversation](#) · 🗨️👍👍

Sean Thomas Larkin @TheLarkInn 5 h

En réponse à @andrewvijay @code @MSEdgeDev
No they are not electron apps. They are compiled to native code. It's now finally one toolchain(#webpack) It's one codebase and it compiles to: Web Android IOS MacOS UWP WIN32 (only one that uses electron)

How is being compiled to native code? Which tool? Webpack is doing great work in MS I see!

Interesting - how about the 2019 Preview? Is that fast again? Will outlook finally be multitasked or will IMAP still block the UI?

We have multiple forks of react-native for each platform. Of course combined with ReactXP and friends. :)

webpack handles making the JS as optimized as possible, passes to our RN, it does the rest

Have some comms to get going with FB team to see if they want to accept changes upstream. History has shown sometimes non-interest to maintain things they don't care about/need/use.

C++ modules are pretty different from JavaScript modules ☹️ See wg21.link/p1087r0 for what's closest to the current proposal. One of the authors works for your employer!

Im not aware of how RN works internally. I assumed it would just bundle up js and run in a VM. But it compiled to native code? If so then flutter is redundant here

May be it's time for Ms for releasing it as a plugin to compile to native! I'm expecting RN must be having a plugin system of some sort. If not ask them to look at tapable :)

It's not as simple as a plug-in I've been told. I'm not the lead on that team so I can't comment more, but I know that if it was that easy, we'd already do it. OSS is lifeblood to us.

Hmm. Kudos to the person who came up with this idea though! Someone should do a talk about this. Also how about the resource usage compared to the existing native apps? You know anything about that?
