Shots Fired Again Between CPU Vendors AMD and Intel (tomshardware.com)

Posted by <u>BeauHD</u> on Tuesday June 19, 2018 @06:00AM from the Wild-West dept.

<u>Highdude702</u> shares a report from Tom's Hardware: *AMD's feud with Intel took an interesting turn today as the company announced that it <u>would swap 40 Core i7-8086K's won from Intel's sweepstakes with a much beefier</u> <u>Threadripper 1950X CPU</u>. At Computex 2018, Intel officially announced it was releasing the Core i7-8086K, a special edition processor that commemorates the 40th anniversary of the 8086, which debuted as the first x86 processor on June 8, 1978. Now AMD is offering to replace 40 of the winners' chips with its own 16-core 32-thread \$799 Threadripper processors, thus throwing a marketing wrench into Intel's 40th-anniversary celebration.*

AMD has a list of the complete terms and conditions on its site. But it is also noteworthy that "winners" of AMD's competing sweepstakes will have to pony up for a much more expensive X399 motherboard with the TR4 socket, which currently retail for more than \$300, instead of Intel's less-expensive 300-series motherboards. Regardless, those who do swap their Intel Core silicon for an AMD Threadripper chip will gain 10 cores and quad-channel memory, not to mention quite a bit of resale value. In response, Slashdot reader Highdude702 said: "AMD is shooting back at Intel like its easy for them, even though 40 out of 8086 is kind of stingy. They are acting like they have the horsepower now. I believe it is going to be an interesting time for consumers and enthusiasts coming soon. Maybe we will even get better prices."

Intel responded via its official verified "Intel Gaming" Twitter account, <u>tweeting</u>: ".@AMDRyzen, if you wanted an Intel Core i7-8086K processor too, you could have just asked us. :) Thanks for helping us celebrate the 8086!"

Dude, Intel intel isn't in a position to talk crap. Or rather that's all they can do because they have squat to compete with, and everyone but the terminally stupid knows it.

Did you see that ridiculous "5 GHz" demo they made at Computex? Allegedly coming "soon" to market. Oh wait it's not, they "forgot" to tell it was a 1kW+ overclocked abortion on a custom 28 phase VRM, with an industrial 1kW water-cooler keeping the coolant at sub-ambient, most probably -10 C. A several years old CPU at that which

normally sells for 10k+ USD?

That's desperation right there. Intel have emptied the cupboards, they have nothing left. Anything new will take years to come to market.

by <u>PixetaledPikachu (1007305)</u>

Businesses are already beginning to switch over to EPYC.

No they really aren't. At least not in any significant way, it takes multiple generations of hardware to win over larger enterprises and AMD still have to prove themselves in the longhaul, enterprises don't switch just because one gen happens to be better. I hope AMD are on a winning streak but it will take at least a 2-3 more years of them maintaining a significant advantage to have a real market impact.

I just checked that the L8s_v2 and L16s_v2 (L series v2) has popped up on my VM size selection on my Azure dashboard. Those specifically use AMD EPYC 7551 processors. So yeah, EPYC has already entered production environment in Azure

Even better, look at TCO. AMD's sockets and motherboards have historically lasted a lot, lot longer than Intel's.

Also, AMD give you more PCIe lanes, so if/when USB 4.0 or Thunderfart X comes out you should be able to slap a card in and get decent performance without having to replace the motherboard just to get enough lanes for full performance.
