Why bother pre-ordering?

I guess it depends where you live, but you can normally get these from a retail store the same day as it is released, and without having to wait for it to get shipped.

Unlike iPhones there isn't much of a Line for iPads.

Eliminates probability of wait (Score:2)

by SuperKendall (25149)

The store may not have the exact build configuration you want, and if you wait to order the shipping times can easily go out several weeks if there's any surge in popularity - the probability of that is higher with this round of iPads which will be more of a change than previous iPad iterations.

I generally agree with your sentiment about many Apple Events being big press releases (though not very expensive for Apple at all considering the coverage they get!!).

However, I don't think the hardware changes for the iPad this time are all that minor. They'll probably be getting FaceID for one, also the latest processors and neural engine that are in the latest iPhones, so that is quite a large performance boost.

Especially interesting is how much the latest Apple processors have helped increase <u>Javascrip</u> [twitter.com]

■ <u>Re:</u> (<u>Score:2</u>)

by Dallas May (4891515)

All of those items you list could be just as easily said in a 1-page press release and website update. None of them are new or really deserving of an "We call it the iPhone" style event.

That said, heck yeah the massive press is 100% worth it for Apple. That's why everyone -Google, Samsung, Amazon, literally everyone- is doing these big events now for every minor upgrade.

<u>Re:</u> (<u>Score:2</u>)

by SuperKendall (25149)

I disagree because the switch to FaceID and dropping the button, means there are some changes to the UI that aren't really great to put in a press release. Starting with the iPhone launch the events have been useful as mini tutorials that people actually watch, and in this case that tutorial will be helping a lot of peopler understand how a FaceID iPad will work.

As I said though I generally agree with your assessment of most of these events, including Apple. To me the one for the iPhone just a month or tw

Do you remember when you could buy a Mac Mini with non-soldered RAM, a quad core CPU, and a replaceable disk?

If you want non-soldered RAM and user replaceable disks you need to show Apple a business case where it makes sense for them. The number of people who upgrade RAM in their machines is a rounding error and I'm pretty sure Apple has the data to prove it. If the number of your customers who take advantage of a feature is a good approximation of zero then why incur the added cost (design, manufacturing, purchasing) of the more complicated device? If it is more profitable for them to just deal with it as a wa

<u>Re:</u> (<u>Score:2</u>)

by <u>edwdig (47888</u>)

I think it's more that building in the RAM means you have to buy your RAM upgrades from Apple. Without soldered RAM & storage, it's often a lot cheaper to buy computers with the minimum amount of RAM and SSD included, then upgrade it after. Now you're forced to buy what you need directly from Apple. And you're likely to overestimate your needs because you can't change it later. That's several hundred dollars extra profit per system on the high end models.

Cost savings (Score:2)

by sjbe (173966)

I think it's more that building in the RAM means you have to buy your RAM upgrades from Apple.
Sure that's part of it - Apple can bring in extra revenue that way. But don't underestimate the cost savings from not having to add the hardware to interface with the memory modules. They also don't have to design a user serviceable product which saves money too. They don't have to source the more complicated modular parts, they can have simpler assembly procedures, they reduce warranty costs by not having to deal with third party parts and ham handed users, etc. They realize these savings on EVERY devi

"Business cases that make sense" can be loops, feeding themselves. (I'm sure there is a fancy economic-science term for it, but I don't know it.)

If Apple don't make devices that can get hardware upgrades then users will not know about hardware upgrades, so they won't request them.

It is like with Windows users: they expect clunky UIs, their systems getting slower over time and full of malware -because they have not been exposed to anything better!

How? I would buy one if I could get 32GB of RAM and a quad-core i7 (ie, match my Linux box which cost half as much as what they do sell). But I can't, so I don't buy one. A Mac Pro is way _more_ computer than I need, so I also don't buy one of those. So rather than upgrade, I just stick with docking an older macbook (before they decided to screw up their keyboards). I actually considered buying an iMac as an alternative, but I value being able to KVM between my various machines.

To be fair, I don't give

Don't be ridiculous. Most Windows desktops and laptops have user upgradable memory and the VAST majority of people and companies never touch it. They don't even open the case to look. This is not some sort of new revelation. People rarely upgraded memory on Macintoshes when they could do it and Apple provided the opportunity for literally decades. It shouldn't surprise anyone that Apple looked at the data and said "we can make more money by eliminating something almost none of our users are bothering w

by <u>Theaetetus</u> (<u>590071</u>)

It is, however, constraining for people who don't desire an integral monitor. Deal breaking, in fact. Why is that deal breaking?

For a guess, some people want to go with dual, triple, or quad-monitor setups with identical monitors. That's not possible with the iMac Pro, since Apple doesn't offer a matching standalone monitor. You can get close, but they won't match, and the large lower bezel on the Pro's monitor makes certain configurations difficult, if not impossible.
