La situation épidémiologique en Belgique est particulièrement confuse. Pour mieux comprendre les contradictions apparentes, il faut prendre en compte la différence entre taux de contacts des vaccinés et non-vaccinés et les différentes formes d'efficacité vaccinale. Thread 1/20

La première chose, c'est que c'est l'efficacité vaccinale (EV) contre l'infection (être porteur) qui diminue le plus vite avec le temps depuis la vaccination, suivie de l'EV contre l'infection symptomatiques (être malade), suivie de l'EV contre le risque d'hospitalisations. 2/20

Le deuxième élément, c'est que les enquêtes Comix montrent que les non-vaccinés ont en moyenne deux fois moins de contacts infectieux que les vaccinés, sans que l'on sache si c'est le bénéfice du CST ou d'une volonté de se protéger. 3/20 uhasselt.be/UH/71795-start...
