You can actually fit 3x 120mm fans on the bottom part of the case? Is it such a hassle to fit in?

4 Reply Share Report Save

LikaSomeB00DY **OP** · 4d

Yup, you can fit in 3x120 fans. It wasn't difficult to install, especially SL fans. The 2 holes on the very edge of each end

I thought about it, but I prefer leaving it untouched. I'm searching for some circle labels to blend in with the fans.

How do you have the fans setup? I'm in the process of building mine. Front and bottom intake? and than the rest exhaust?

1 Reply Share Report Save

LikaSomeB00DY **OP** · 4d

Side and Bottom: Intake

Top and Rear: Exhaust

Front: None (If I was going to add 2 fans on the front, it would be intake)

(If doing push/pull configuration, I added 2 additional fans behind the radiator as intake)

Can the front mesh be removed so you can see through clearly?

Thanks for the compliment. It took some patience to get the parts that I was looking for. Biggest challenge was trying to find the perfect case with the right dimensions.

Looks damn good. More effort now since its installed, but another redditor was able to take the shiny lianli badge on the intake side and cover the back so they all match. He said it popped off with a knife very easily.

I've seen that video on YT and thought about it, but I realized it's better to be left untouched imo.

I believe you should be able to mount vertically, especially for a Strix card that big. You might want to watch out for the rear fan, which might get in the way.

Thank you for posting this. I am about to migrate my system to this case and I can't decide how I want to do it. I never even considered not having fans in the front. This looks so clean.

ATX board? I have the same fans and a white 3090 strix (I think it should be the same size) and I want to switch to this from an O11 XL.

There was a video on YT of someone trying to fit a 360 rad on the top panel and mentioned being a few mm over the length of the case.

Hey, I am currently running a very similar build but instead it is black but that's besides the point. I wanted to know if the lian li fans and the trident z ram look similar in terms of their white? I'm curious because my trident z ram looks very yellowy and I'm wondering if I should get a replacement or try and looks for another pair of ram. I know cameras capture light slightly different than our eyes and in the picture it looks good. Any help would be much appreciated.

My ram sticks are not as fluorescent as the uni fans as shown in pic. I would look into the t force xtreem white or
