

What is Deployer?

A deployment tool written in PHP with support for popular frameworks out of the box.

Why should you use Deployer?

1. Automatic server **provisioning**.
Deployer will configure your server, setup a **firewall**, install **PHP** and **MySQL**, configure **SSL**, etc.
2. **Zero downtime** deployments.
Did something go wrong? **Rollback** to the previous release.
3. Ready to use recipes for **most frameworks** and **applications**.

How to install?

```
composer require deployer/deployer
```

Other [installation methods](#).

How to get started?

We have a great tutorial: [Get Started](#)

Who use Deployer?

Deployer used by *hundreds thousands* of projects around the world, performing more than a **million** of deploys each month. Deployer comes with more than **50** ready to use recipes for frameworks and third-party services.

History and evolution

Deployer was created by [Anton Medvedev](#) on 11 Jul 2013 (8 years ago). Deployer continues to evolve: core task runner was rewritten recently, recipes get improvements from the community, and patches to support changes in a newer version of frameworks and applications.
