Brian Roemmele @BrianRoemmele

South Korean professor Cho Jae-weon invented a toilet that turns poop into energy and pays people in digital currency.

A person defecates~ 500g/day converted into 50 liters of methane gas which generates 0.5 kWh.

Toilet users earn Gcool, a literal sh3t coin.

For the "debunker" crowd:

reuters.com
 South Korean toilet turns excrement into power and digital currency
 Using a toilet can pay for your coffee or buy you bananas at a university in South Korea, where human waste is being used to help power a building.

Is it anything more than an anaerobic digestion tank that pays people for their waste?

Colin Brown @thecolbrown · 7h

Think just a fancy biogas generator. About to build one myself with an IBC tote.
