Made for Making

Focus, control, privacy, and performance.

Caligra makes tools for technical environments. Situations where people depend on the results of your work. Where attention is important, and the flow state is precious. Where getting things done is what matters most. It’s a computer, built with a different set of principles. For whatever you’re making—we work for you.

c100 runs [Workbench](#), a Linux-based operating system built for technical work. It’s designed to get out of your way, so your team can deliver more.

Computers  
for experts

Most people don’t write code or manage data, and consumer devices are designed accordingly.

But change isn’t made by most people. Progress comes from the people whose work improves our understanding and ability.

Scientists and artists.  
Engineers and designers.  
Hackers and painters.

We think the world needs a brand of computing that stands behind creative technical work, dedicated to creating instead of consuming.

Caligra is a new computer company. Our goal is to help you make the future.
