

building blocks for your desktop

Configuration by [soramane \(install\)](#)

Quickshell is a toolkit for building status bars, widgets, lockscreens, and other desktop components using QtQuick. It can be used alongside your wayland compositor or window manager to build a complete desktop environment. [More information](#)

See your changes in real time

Quickshell loads changes as soon as they're saved, letting you iterate as fast as you can type.

Easy to use language

Quickshell is configured in QML, a simple language designed for creating flexible user interfaces. It also has LSP support.

```
// a standard desktop window
FloatingWindow {
    Timer {
        // assign an id to the object, which can be
        // used to reference it
        id: timer
        property bool invert: false // a custom property

        // change the value of invert every half second
        running: true; repeat: true
        interval: 500 // ms
        onTriggered: timer.invert = !timer.invert
    }

    // change the window's color when timer.invert changes
    color: timer.invert ? "purple" : "green"
}
```

Extensive integrations

Quickshell comes with a large set of integrations, with new ones arriving all the time.
