And now for something completely different.

360 degree camera tiny planet view of the apparent movement of the stars.

Polaris is in the center of the smallest circle on the left of video. The white lines are the star trails from 10pm to 4am.

This is something I've wanted to do for a while.

0:00 / 0:23

A night video showing a tiny planet view of my house, we see concentric circles appearing on both sides, these are star trails showing the apparent movement of the stars over the course of a clear night. Using a 360 degree camera I was able to get this video.
